trained on 1,500 machine rollouts of the original policy
(431k controls, action noise 0, 10, 25 px; no human demos)
Now
block pose
and speed,
pusher position
+ pusher target
Pusher motion
copied from the simulator:
PD law, 10 substeps
(matches it to 0.0001 px)
Contact gate
copied: exact distance from
the pusher to the letter's
rectangles; no contact →
the block does not move
Block motion
learned: small network in
the block's own frame,
only while in contact
Next
no contact: motion exactly zero
copied from the simulator (exact)
learned from data
input / output state
